

PHYTOPLANKTON OF THE TISA RIVER

ANA RŽANIČANIN, M. CVIJAN and JELENA KRIZMANIĆ

Institute of Botany, Faculty of Biology, University of Belgrade, 11000 Belgrade. Serbia and Montenegro

Abstract - Investigation of the Tisa River phytoplankton community was carried out directly after the cyanide spill in 2000. The investigation took place near Bečej from February of 2000 to January of 2001. We observed 374 taxa from eight algal divisions. The highest biodiversity was recorded among the divisions *Chlorophyta* and *Bacillariophyta*.

Key words: Tisa River, Serbia, phytoplankton, algae

UDC 574.583(282.243.742)(497.113)

INTRODUCTION

The present paper reports the results of a one-year investigation of the Tisa River phytoplankton community.

The Tisa River is one of the largest Central European flatland rivers and the biggest Danube tributary (Uherkovich, 1971). It is one of the most important rivers of the Balkan region and Europe.

Phytoplankton investigation was carried out after the cyanide spill on the Tisa River in January of 2000.

The aim of this study was to determine biodiversity of the phytoplankton community in the Tisa River after this accident. Algae are one of the most important primary producers in almost every water ecosystem. At the same time, these organisms are very sensitive to changes in their environment.

MATERIAL AND METHODS

Investigation samples were collected from February of 2000 to January of 2001 near Bečej, weekly and monthly.

Sampling for qualitative analysis was carried out in February, March, April, June, July, September, and November of 2000, which enabled us to follow the seasonal dynamics of phytoplankton. The standard method was used for sample collection a plankton net was drawn through the water.

Samples for quantitative analysis were collected in one-liter plastic bottles every week from February 16, 2000 to January 31, 2001. Altogether, 55 quantitative samples were collected during this period.

Table 1. Participation of divisions in the phytoplankton community of the Tisza River

Division	Number of taxa	%
<i>Cyanophyta</i>	43	11,49
<i>Rhodophyta</i>	1	0,27
<i>Pyrrophyta</i>	6	1,60
<i>Xanthophyta</i>	7	1,87
<i>Chrysophyta</i>	4	1,07
<i>Bacillariophyta</i>	129	34,49
<i>Euglenophyta</i>	17	4,54
<i>Chlorophyta</i>	168	44,92
Total:	374	100

Phytoplankton taxa were determined in samples for qualitative analyses. Physical and chemical characteristics - air and water temperature, water pH, water clarity, and oxygen concentration in the water, were measured during collection of the qualitative samples.

RESULTS AND DISCUSSION

During the investigation period, we recorded eight algal divisions. The list of divisions and their participation in the phytoplankton community of the Tisa River are

Table 2. Floristical list of phytoplankton taxa found in the Tisa River from February of 2000 to January of 2001

given in Table 1.

Table 2 gives the list of determinated phytoplankton taxa with their monthly distribution in the Tisa River.

Altogether we recorded 374 taxa (Tables 1 and 2), which indicates high biodiversity of the phytoplankton community in this ecosystem, regardless of the cyanide spill and heavy metal pollution at the beginning of the investigation period. Data indicating a rich and heterogeneous phytoplankton community in the Tisa River were also recorded previously (Uherkovich, 1971; Guelmino, 1973; Subakov, 2000; Branković and Budakov, 2001).

The results indicate that *Chlorophyta* was the qualitatively dominant division, while *Bacillariophyta* was subdominant during the investigation period.

The highest biodiversity of green algae was during the summer and autumn period, whereas *Bacillariophyta* was the dominant group during the colder period of the year. A similar situation was observed earlier (Kalafatić *et al.* 1982; Đukić *et al.* 1994; Dulić and Mrkić, 1998; Subakov, 2000). This is consistent with ecological characteristics of these algae (Trainor,

1978; Blaženčić, 2000) and ecological conditions in the given ecosystem during the period of investigation (Ržaničanin, 2004).

A significant number of taxa were found within *Cyanophyta*, while representatives of *Euglenophyta* were less numerous. Most taxa of the *Cyanophyta* and *Euglenophyta* found in the Tisa River were characteristic of slow, flatland rivers and stagnant water, and they were also registered during earlier investigations (Protić, 1939; Uherkovich, 1971; Guelmino, 1973; Kalafatić *et al.* 1982; Pušin *et al.* 1999; Subakov, 2000).

Rhodophyta, *Pyrrophyta*, *Xanthophyta*, and *Chrysophyta* were represented by a small number of taxa. Their participation in the phytoplankton community of the Tisa River was extremely small. Earlier studies likewise revealed a small number of taxa from these divisions (Protić, 1939; Szabados, 1966; Uherkovich, 1971; Guelmino, 1973; Kalafatić *et al.* 1982; Dulić and Mrkić, 1998; Pušin *et al.* 1999; Subakov, 2000; Branković and Budakov, 2001).

ФИТОПЛАНКТОН РЕКЕ ТИСЕ

АНА РЖАНИЧАНИН, М. ЦВИЈАН И ЈЕЛЕНА КРИЗМАНИЋ

Институт за ботанику, Биолошки факултет, 11000 Београд, Србија и Црна Гора

Након изливања цијанида 2000. године извршено је једногодишње истраживање диверзитета фитопланктона реке Тисе код Бечеја. Утврђено је присуство 374 таксона из 8 раздела алги: *Cyanophyta*, *Rhodophyta*, *Pyrrophyta*, *Xanthophyta*, *Chrysophyta*, *Bacillariophyta*, *Euglenophyta* и *Chlorophyta*. Највећи

диверзитет забележен је у оквиру раздела *Chlorophyta*, док је раздео *Bacillariophyta* био субдоминантан. По броју таксона издвајали су се још *Cyanophyta* и *Euglenophyta*, док је диверзитет осталих забележених раздела био занемарљив.
